

ABSTRACT OF THE DISCLOSURE

A method and a health care system utilizing the method for providing treatment to a patient including healthcare services which includes obtaining and recording data from the patient relating to background data, such as demographics, insurance information and medical history; staging and diagnosing the patient's ailment; obtaining and recording data relating to the patient's quality of life and economics; obtaining a range of preferred treatments based upon the staging, quality of life and economic data; and providing treatment to the patient. After treatment, second quality of life and economic data are obtained, recorded, and utilized to amend the range of preferred treatments to maximize the second quality of life and economic factors. In an alternative embodiment, the method and system include means for timing the delivery of treatment and for conditioning payment to the healthcare provider upon completion of the treatment within prescribed time periods.
